

# Biology 8B — Unit Test: Cells & Organisms

Name: Toby King

Class: Biology 8B

Date: 2026-08-22

---

**Q1. What is the basic structural and functional unit of life?**

A: The cell.

**[correct] Correct — clear and accurate.**

**Q2. Give one example of how an organism interacts with others in its ecosystem.**

A: Predators hunt prey for food, and producers make food from sunlight.

**[correct] Correct — good example of a food-chain interaction.**

**Q3. Explain what happens to chromosomes during meiosis, and why this matters for genetic inheritance.**

A: Cells just split into two somehow.

**[incorrect] Incorrect — missing chromosome pairing/crossing over; doesn't explain inheritance.**

**Q4. Name two organ systems in the human body and one function of each.**

A: Digestive system breaks down food; respiratory system exchanges oxygen and CO<sub>2</sub>.

**[correct] Correct — both systems and functions accurate.**

**Q5. What is a genotype, and how does it differ from a phenotype?**

A: Genotype is the genes an organism has, phenotype is a random word for looks.

**[incorrect] Incorrect — phenotype defined too vaguely; doesn't link it to genotype expression.**

---

Score: 3/5 Teacher comment: Good grasp of cells, organisms, and human body — review meiosis and genotype/phenotype before the next test.
